

Importing data

Created using Maple 14.01

Jake Bobowski

```
> restart;
with(StringTools):
FormatTime("%m-%d-%Y, %H:%M");
"08-04-2012, 10:31" (1)
```

Here's how to read in data from a text file. Notice is the awkward double slash \\ syntax. If you're trying this example, it will only work if you place the file "data1.txt" in the C:\\ directory. Alternatively, put "data1.txt" where you like and modify the path in the *readdata* statement.

```
> data1 := readdata("C:\\import data1.txt", [float, float]);
data1 := [[1., 1.], [2., 4.], [3., 9.], [4., 16.], [5., 25.], [6., 36.]] (2)
```

Instead of "[*float, float*]", the synatax '*float, 2*' can be used. As will be seen below, this is useful when the data file has many columns.

```
> data1 := readdata("C:\\import data1.txt", float, 2);
data1 := [[1., 1.], [2., 4.], [3., 9.], [4., 16.], [5., 25.], [6., 36.]] (3)
```

Columns and elements of the table of data can be accessed using

```
> data1[1];
data1[2];
data1[2, 1];
data1[2, 2];
[1., 1.]
[2., 4.]
2.
4. (4)
```

To make lists of the *x* and *y* values (to use for plotting for example), the *seq* command can be used.

```
> x := [seq(data1[i, 1], i = 1 .. nops(data1))];
y := [seq(data1[i, 2], i = 1 .. nops(data1))];

x := [1., 2., 3., 4., 5., 6.]
y := [1., 4., 9., 16., 25., 36.] (5)
```

Here's an example of a large data file buried deep in some file structure. This data file has 501 columns and each column has 2500 entries.

```
> data2 := readdata("D:\\Jake's\\UBCO\\2012-2013\\Maple tutorials\\import data2.dat", float,
501) :
nops(data2);
2500 (6)

> data2[1];
nops(data2[1]);
